# Fast Track Surgery and Surgical Carepath in Optimising Colorectal Surgery

R Sim

Centre for Advanced

Laparoscopic Surgery, TTSH

# Conventional Surgery

## Postop care

- Nasogastric tube
- Enteral feeds when ileus resolves
- Opioid analgesics

## Results

- Morbidity, mortality
- LOS
- Oncologic outcomes – recurrence, survival

# Lessons from Laparoscopic Surgery

## Postop care

- Early feeding possible
- Smaller incisions, less pain, faster recovery
- Early ambulation

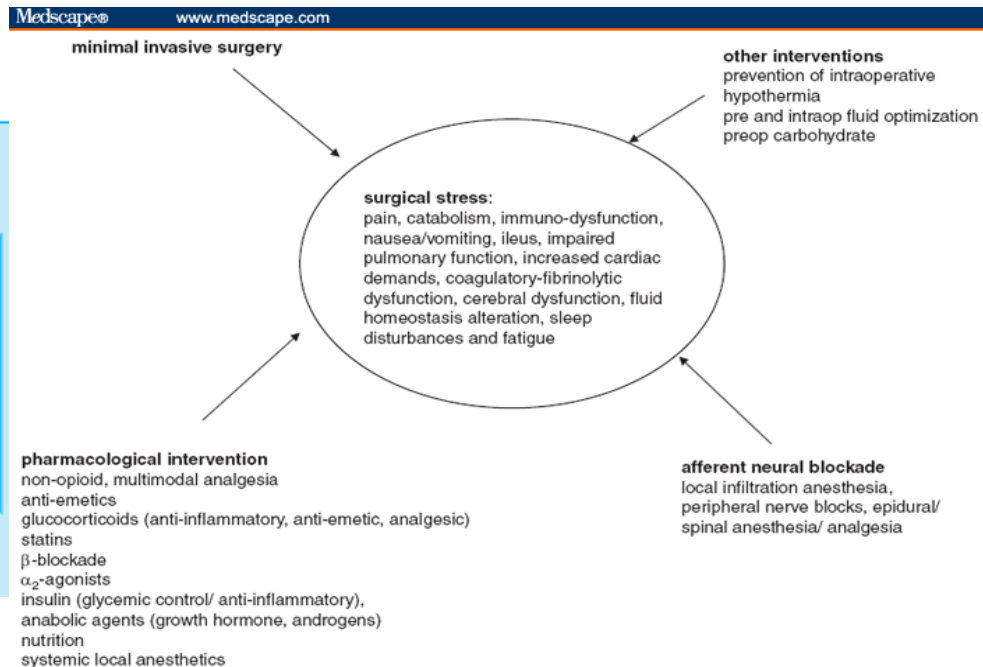

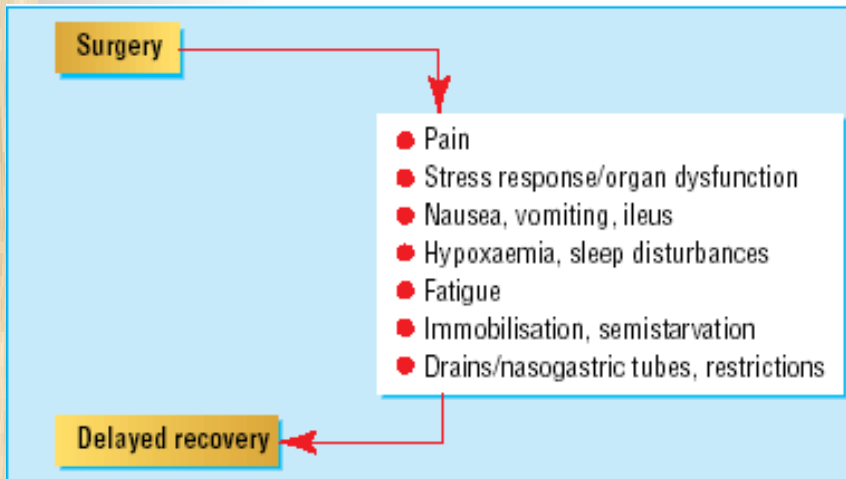

## Results

- Return to work
- Fatigue level, QOL
- Cost vs Charge

# What is fast track surgery?

Fast track surgery aims to accelerate postoperative recovery by taking advantage of knowledge about the stress response to surgery to prevent the postoperative cascade that prolongs recuperation

**Gastrointestinal transit after laparoscopic vs open colonic resection.** Kehlet et al. Surg Endosc (2003) 17: 1919-1922

N=32

**CONCLUSION:**

Postoperative ileus and gastrointestinal transit normalized within 48 h after colonic resection in the patients who received multimodal rehabilitation. No significant difference was observed between the patients who underwent the laparoscopic procedure and those who underwent the open procedure.

Protocol for Anesthesia, Surgery, and Rehabilitation Program After Colonic Resection With Conventional Care

1996 Jun; 62(6):499-502

Epidural analgesia does not shorten postop ileus after IPAA

1995 Oct; 170(4):371-4

PCA after uncomplicated colectomy increases the risk of prolonged postop ileus

**Epidural anesthesia-analgesia shortens length of stay after laparoscopic segmental colectomy for benign pathology.** Senagore et al. *Surgery* 2001;129(6):672-6

N=44

### **CONCLUSION:**

Thoracic epidural anesthesia-analgesia has a significant and favorable impact on dietary tolerance and length of stay after LAC. A thoracic epidural appears to be an important component of a postoperative care protocol, which adds further advantage to LAC without the need for labor-intensive and costly patient care plans.

**Randomized clinical trial comparing epidural anaesthesia and patient-controlled analgesia after laparoscopic segmental colectomy.**

Senagore et al. Br J Surg 2003;90(10):1195-9

N=38

**CONCLUSION:**

Thoracic epidural analgesia significantly improved early analgesia following laparoscopic colectomy but did not affect the length of hospital stay.

# Reduction of postoperative mortality and morbidity with epidural or spinal anaesthesia: results from overview of randomised trials.

Rodgers et al. BMJ 2000;321:1-12

N=141 trials including 9559 patients

## **CONCLUSION:**

Neuraxial blockade reduces postoperative mortality and other serious complications. The size of some of these benefits remains uncertain, and further research is required to determine whether these effects are due solely to benefits of neuraxial blockade or partly to avoidance of general anaesthesia.

Anesth-Analg. 1998 Feb; 86(2):235-9

# Early enteral feeding versus "nil by mouth" after gastrointestinal surgery: systematic review and meta-analysis of controlled trials.

Lewis et al. BMJ 2001;323:773-6

N=11 trials including 837 patients

## **CONCLUSION:**

Early feeding reduced the risk of any type of infection and the mean length of stay in hospital. Risk reductions were also seen for anastomotic dehiscence, wound infection, pneumonia, intra-abdominal abscess, and mortality, but these failed to reach significance. The risk of vomiting was increased among patients fed early.

**Gum chewing enhances early recovery from postoperative ileus after laparoscopic colectomy.** Asao et al. J Am Coll Surg 2002;195:30-2

N=19

**CONCLUSION:**

The first passage of flatus was seen, on average, on POD 2.1 in the gum-chewing group and on POD 3.2 in the control group ( $p < 0.01$ ). The first defecation was 2.7 days sooner in the gum-chewing group (POD 3.1) than in the control group (POD 5.8;  $p < 0.01$ ). The postoperative hospital stays for the gum-chewing and control groups were 13.53 days and 14.56 days, respectively.

Does mechanical massage of the abdominal wall after colectomy reduce postop pain and shorten the duration of ileus? Results of a randomized study. Le Blanc-Louvry et al.

J Gastrointest Surg 2002 Jan-Feb;6(1):43-9

N=50

### **CONCLUSION:**

From the second and third postop days, respectively, VAS pain scores ( $P < 0.001$ ) and doses of analgesics ( $P < 0.05$ ) were significantly lower in patients receiving active massage compared to the placebo group. Time to first passage of flatus was also significantly shorter in the active-massage group (1.8 days vs. 3.6 days,  $P < 0.01$ ).

## Drugs to decrease postoperative ileus

Propranolol, dihydroergotamine, neostigmine, erythromycin, cisapride, metoclopramide, cholecystikinin, octreotide and vasopressin - most with either limited effect or limited applicability because of adverse effects.

5HT<sub>4</sub> receptor agonist - prucalopride, tegaserod

New peripherally selective mu-opioid antagonists -  
Alvimopan, MNTX

**Postoperative ileus-related morbidity profile in patients treated with Alvimopan after bowel resection. Wolff, et al. JACS 2007; 204(4): 609-16**

N=4 trials, 1409 patients

**CONCLUSION:**

Less likely to experience POI-related morbidity (alvimopan, 7.6%; placebo, 15.8%, odds ratio=.44,  $p < 0.001$ ). There was also a lower incidence of postoperative NGT insertion, and other GI-related adverse events on postoperative day 3 to 6 in the alvimopan group than the placebo group. Opioid consumption was comparable between the two groups.

# COX-2 inhibitors

Original article

doi:10.1111/j.1463-1318.2006.00998.x

## Prospective randomized, double-blind, placebo-controlled study of pre- and postoperative administration of a COX-2-specific inhibitor as opioid-sparing analgesia in major colorectal surgery

R. Sim\*, D. M. Cheong\*, K. S. Wong†, B. M. K. Lee‡ and Q. Y. Liew‡

\*Department of Surgery, Tan Tock Seng Hospital, †Department of Surgery, National University Hospital and ‡Department of Anaesthesiology, Tan Tock Seng Hospital, Singapore

Received 12 October 2005; accepted 9 December 2005

### Abstract

**Purpose** To demonstrate the opioid-sparing effect and reduction in postoperative ileus obtained with valdecoxib 40 mg administered pre- and postoperatively in patients undergoing colorectal resection.

**Methods** Patients for elective colorectal resection from December 2002 to June 2004 were randomized to receive either valdecoxib or placebo with standard patient-controlled analgesia (PCA) morphine. In the study arm, the first dose of valdecoxib 40 mg was administered orally as close as possible to 1 h prior to the start of surgery. Each subsequent dose was admin-

incision length, and duration and types of operations. Mean PCA doses at 12 and 24 h were 18.6 and 28.3 mg in the study arm *vs* 26.2 and 41.2 mg in controls, representing a one-third opioid reduction. Bowel sound and movement first appeared at medians of 12 and 72 h in the study arm *vs* 24 and 84 h, respectively, in controls ( $P < 0.05$ ). Tolerance of solid diet was at a median of 60 h and discharge at a median of 4 days in the study arm *vs* 72 h and 6 days in controls ( $P < 0.05$  and  $P < 0.01$ , respectively). Seven (18%) morbidities occurred in the control *vs* six (15%) in the study arm.

# Main Findings

- Preemptive analgesia works in major abdominal bowel surgery
- Oral works, Parenteral not required
- Could not demonstrate the degree to which the preemptive administration of the COX-2 inhibitor contributed to the observed benefits of reduction of POI and opioid usage
- POI was also reduced probably as result of (1) reduced opioid usage, (2) early ambulation with better pain control and (3) attenuated inflammatory response
- Did not address the relative contribution of each factor toward the reduction of postoperative ileus though it is evident that all these factors can be attributed to COX-2 inhibition

# Conclusions

- Postoperative ileus is multifactorial in origin and hence a multimodal approach is likely to be the best means to enhance postoperative recovery.
- The addition of an oral COX-2-specific inhibitor pre- and postoperatively can reduce opioid use, postoperative ileus and length of stay when compared with a standard postoperative patient-controlled analgesia (PCA) morphine regimen after colorectal resection.

**Effect of salt and water balance on recovery of gastrointestinal function after elective colonic resection: a randomised controlled trial.** Lobo et al. Lancet 2002; 359: 1812-18

N=20

**CONCLUSION:**

Positive salt and water balance sufficient to cause a 3 kg weight gain after surgery delays return of gastrointestinal function and prolongs hospital stay in patients undergoing elective colonic resection.

**Effects of Intravenous Fluid Restriction on Postoperative Complications: Comparison of Two Perioperative Fluid Regimens: A Randomized Assessor-Blinded Multicenter Trial.** The Danish Study Group on Perioperative Fluid Therapy. *Ann Surg* 2003; 238(5):641-648

N=172

**CONCLUSION:** Cardiopulmonary (7% versus 24%,  $P = 0.007$ ) and tissue-healing complications (16% versus 31%,  $P = 0.04$ ) were significantly reduced and no patients died in the restricted group compared with 4 deaths in the standard group. Restricted periop iv fluid regimen aiming at unchanged body weight reduces complications after elective colorectal resection.

# What are carepaths?

Carepaths are guidelines and goals to standardise management. They are not intended to establish standards of practice, nor replace individual physician judgment.

Admission / Pre-Operation Day

Arrival at Emergency Department

Check temperature, pulse, respiration and blood pressure

Doctor will examine and explain your current condition, need for operation and nature of operation

Blood investigations to analyse your blood count

Chest x-ray ordered to check your heart and lung if required

Electrocardiography (ECG) ordered to check your heart activity if required

Consent will be taken from you or next of kin once clinical & laboratory finding confirmed the diagnosis of appendicitis (inflammation of the Appendix)

You will be put on nil by mouth. Intravenous therapy will be administered prior to operation

Pre & Post Operation Day

You will be assessed and monitored closely for pain. Pain killer will be given to you either

Prepare, change and send to operating theatre

Duration of surgery depends on severity of the condition

You will be transferred back to the general ward from operating theatre. Your condition will be monitored closely

Intravenous therapy will be continued till reviewed by surgeon.

You have to continue to be on nil by mouth. Food and drink will only be allowed when your bowel movement is heard (bowel sound)

Wound site will be monitored closely for sign of bleeding and infection

Doctor will review and update you and your family on your progress after surgery

Post Operative Day One

Check temperature, pulse, respiration and blood pressure

Doctor's review:

- listen to your bowel sound
- inspect your wound site
- order treatment
- update progress and
- discuss discharge plan

You may be discharged if:

- no sign of wound infection
- diet tolerated
- no severe pain

You will be assessed and monitored closely for pain. You may be taken off the pump and replaced with oral pain killer

Oral intake will be ordered once bowel sound is heard. Start with liquid and progressively to soft diet once tolerated

The nurse will give you and your family advice on the following:

- wound care
- pain control
- follow up appointment

Wound care and self care management and follow up care for removal of stitches if required.

Advice on healthy diet

Advice on smoking cessation

Types of medication, their effects and side effects

If you are fit for discharge, your discharge documents will be given to you at your bedside

Post Operative Day Two

Check temperature, pulse, respiration and blood pressure

Medication will be served to you as ordered

Doctor will examine and discharge you if:

- no sign of wound infection
- Diet tolerated
- pain bearable

The nurses will inform your family of your discharge

Discharge documents and medications will be given to you at your bedside

## Colorectal Clinical Pathways: A Method of Improving Clinical Outcome?

Jane J.Y. Tan, Angel Y.Z. Foo and Denis M.O. Cheong, Department of General Surgery, Tan Tock Seng Hospital, Singapore.

**OBJECTIVE:** Clinical pathways are intended to improve the quality of care. In March 2001, our unit implemented a pathway for patients undergoing major colorectal surgery. The aim of this study was to assess its impact on the quality of patient care.

**METHODS:** We reviewed 204 patients managed using this pathway in 2001, and compared their outcomes with those of a control group of 204 patients who had undergone similar procedures the year before. The endpoints measured were postoperative morbidity, length of stay and readmission rates.

**RESULTS:** Both groups were similar in terms of patient demographics, diagnosis, and nature of surgery performed. In the study group, 61% of patients underwent elective surgery compared with 62% in the control group. The incidence of postoperative morbidity in the study group was 20% compared with 33% in the control group ( $p = 0.003$ ). The rate of readmission as a result of surgical complications was 6% in the study group versus 13% in the control group ( $p = 0.029$ ). The average length of stay was 10.4 days in the study group and 12.1 days in the control group ( $p = 0.105$ ).

**CONCLUSION:** The introduction of a colorectal clinical pathway significantly improved the outcome of patients undergoing major colorectal surgery. [*Asian J Surg* 2005;28(4):252-6]

e	90th Percentile	12 days		21 days	
5	<b>Median ASA</b>	II			
6	<b>Stoma rates</b>	81	25%		
7	<b>No complication vs system variance rates</b>	252	78%	72	22%

# Interventions for major improvement in surgical outcome

# Conclusion

- Postoperative pain and ileus are two major determinants that prevent early discharge after major abdominal surgery.
- Multimodal fast tracking involves thorough patient education, a multidisciplinary team approach to surgical management, minimally invasive techniques, epidural anesthetic, avoidance of opioids, maintenance of the patient's body temperature in the OR, early enteral nutrition and ambulation, and judicious postoperative intravenous fluids.
